NIUB Sustainability Consulting

### **The Ecomapping™- Method: a practical approach to make your lab more sustainable**

Laboratories use a huge amount of water, energy and other resources. Freezers for example use as much energy as a single-family household. When scientists shared their plastic consumption at the #LabWasteDay, they produced on average 300g - 400g plastic waste per day, which accumulates to 70-100kg each year. On the other side, there seems to be little room for maneuver: methods are established and there's no alternative for many single-use plastics. But if you look closer into your routines, operations and methods, there are ways to change. The **Ecomapping™- Method** is a way to examine your labs sustainability impact and to find specific measures to improve your sustainability performance.

## 27 October 2021, 4 pm

(CEST/UCT+2)

The seminar will take place online via Zoom.
