“The Reproducibility Crisis: Can you trust your data?”

Wednesday, 22 May, 9:30 (s.t.)

More than 50% of all published findings in non-clinical biomedical research are not reproducible. Factors predisposing studies for poor reproducibility can occur at the level of the design, execution, analysis and reporting of studies. Based on real-life examples, the lecture will address key causes and explain how they can be addressed.

Prof. Martin Michel is an experimental and clinical pharmacologist with more than 30 years of experience in academia, industry and venture capital. He heads the guideline committee of the International Union of Pharmacology on reproducibility. His research interests focus on the cardiovascular and urogenital system.

Venue: 2nd Floor Seminar Room
Institute of Molecular Biology (IMB)
Johannes Gutenberg University Campus

All are welcome to attend
